

Pledges shouted at a fundraiser, turned into money in the bank.

Heard live, checked twice and collected, with audio proof of who promised what.

0 wrong-person credits in 70 real pledges

AssemblyAI Realtime · Sync · Voice Agent

The screenshot displays the Pledgebook app interface during a fundraising event titled "Harvest Thanksgiving Launching". At the top right, a status box indicates "Sync recheck" with a green checkmark and "Both passes agree". The main section shows "Pledged tonight" as **₦1,600,000** with a progress bar. Below this is an audio waveform. A search bar contains "Mrs. |". A list of pledges is shown, including "BA Engr. Bayo Adekunle" with a **₦100k** pledge marked as "Confirmed". Another entry for "AN Chief Adaeze Nnamdi" is partially visible. A bottom status box notes "Sent to an usher" and "Two amounts in one breath". On the right, a "Private page · Chief Adaeze" box shows a **₦250,000** pledge with a progress bar and the text "₦160,000 paid · rest on Friday".

THE PROBLEM

Millions of naira are promised out loud in one evening. Nobody can prove who promised what.

At Nigerian church launchings and school fundraisers, the MC calls names and amounts over music and applause. The record is a scribbled sheet of paper.

**“Chief Emeka Okonkwo,
two-fifty!”**

Shouted in Pidgin and English over a live band

**“Emeka Okonkwo,
₦25,000”?**

Names misspelled, amounts misheard on paper

Months later...

No evidence of who promised what, so pledges go uncollected

HOW PLEDGEBOOK WORKS

A pledge heard once is not yet a fact.

It enters the ledger only after two independent AssemblyAI passes agree, or a person decides.

1 · HEARD LIVE

Every pledge on screen within seconds.

- ✓ The MC's microphone streams to AssemblyAI Realtime.
- ✓ Guest names are sent as key terms, so "Okonkwo" is heard as Okonkwo.
- ✓ Every line keeps the exact audio clip as evidence.
- ✓ A Big Screen view shows the total to the hall.

2 & 3 · CHECKED TWICE, THEN A PERSON DECIDES

Disagreement stops the line. An usher settles it.

- ✓ AssemblyAI Sync re-transcribes each clip independently.
- ✓ Unknown name, two amounts in one breath, "250" without thousand: flagged.
- ✓ Ushers play the clip on their own phone and decide. They never see contact details.
- ✓ A name they fix is pushed back into the live session.

4 · COLLECTED, BY VOICE

A voice agent that knows whose pledge it is.

ASSISTANT

Hello, I am the automated Pledgebook assistant for Grace Chapel. Am I speaking with Chief Emeka Okonkwo?

GUEST

Yes, this is Emeka Okonkwo.

`confirm_identity → true`

ASSISTANT

The amount still to pay is ₦250,000. Pay now, choose a date, or tell me if something is wrong?

GUEST

I would like to pay now, please.

`open_checkout → payment button on his screen`

Live AssemblyAI Voice Agent session, 30 Sep 2026. Guest voice synthesized for the recording; tools are real server calls.

SPEECH TO MONEY

Paid in full, credited exactly once.

- ✓ The guest pays all or part through Paystack.
- ✓ A signed webhook credits it; the reference, amount and currency are verified.
- ✓ The treasurer sees it instantly, with every step on the timeline.

0

pledges missed

48/60

clear lines reached the
ledger with no human
touch

The other 12 lines went to an usher instead of being guessed. On the live site, a real voice-agent session opened checkout and a ₦250,000 Paystack test payment was credited by the signed webhook.

A WORKING PRODUCT, NOT A MOCK-UP

Built for real launchings.

Organisations & roles

Owner, admin and usher. Ushers never see phone numbers or emails.

Full event lifecycle

Set up, live, paused, ended, reopened, archived. Sample events to rehearse.

Guest pages

Hear your moment, pay in parts, pick a date, dispute, or stop reminders.

Evidence & audit

Every clip, both passes and every action logged with who and when.

Money safety

Signed Paystack webhooks, credited once, offline payments, settlement report.

Privacy & limits

Audio deleted on schedule, per-organisation usage limits, 112 automated tests.
